(54) Title: TWO STEP ACTIVATION OF PHONE

(57) Abstract: The present invention relates to a communication apparatus having a first housing member pivotally coupled to a second housing member, a controller operable in a plurality of operation states, and a detector associated with the first and second housing members and connected to the controller. The detector is adapted to detect an angle position related to the first and second housing members and supply an angle position detection signal to the controller. The controller is adapted to enter one of a plurality of operating states when said angle position detection signal represents an angle position within one of a plurality of intervals, respectively. The invention further relates to a method comprising detecting the angle position related to the first and second housing members, and entering one of the plurality of operating states of the communication apparatus related to one of the plurality of intervals, respectively, for operating the communication apparatus.
